Fluids during surgery should be considered to reduce the absence of apparent clinical signs. Patients with hepatic dysfunction. Concurrent administration of medication is needed after administration of the total NSAID dose in dogs. NSAIDs inhibit prostaglandins that cause inflammation. Inhibition of COX-1 is thought to be free from adverse reactions. Owners should be informed of the clinical signs associated with drug discontinuation. Consult a physician in cases of accidental ingestion or to report adverse reactions call Nutramax Laboratories, Inc., at 1-800-227-9695.

Tell your veterinarian if your dog is pregnant, nursing or if you plan to breed your dog. What are the possible side effects that may occur in my dog during Carpaquin Caplets therapy? Carpaquin Caplets, like other drugs, may cause some side effects. Serious but rare side effects have been reported in dogs taking NSAIDs, including Carpaquin Caplets. Serious side effects can occur with or without warning and in rare situations result in death.

The most common NSAID-related side effects generally involve the stomach (such as bleeding ulcers), and liver or kidney problems. Look for the following side effects that may indicate your dog may be having a problem with Carpaquin Caplets or may have another medical problem:

- Decrease or increase in appetite
- Vomiting
- Change in bowel movements (such as diarrhea, or black, tarry or bloody stools)
- Change in behavior (such as decreased or increased activity level, incoordination, seizure, or aggression)
- Yellowing of gums, skin, or whites of the eyes (jaundice)
- Change in drinking habits (frequency, amount consumed)
- Change in the skin (redness, scabbing, or scratching)

It is important to stop Carpaquin Caplets therapy and contact your veterinarian immediately if you think your dog has a medical problem or side effect from Carpaquin Caplets therapy. If you have additional questions about possible side effects, talk to your veterinarian.

Can Carpaquin Caplets be given with other medicines? Carpaquin Caplets should not be given with other NSAIDs (for example aspirin, deracoxib, etodolac, firocoxib, meloxicam, tolmetin) or steroids (for example cortisone, dexamethasone, prednisone, triamcortolone). Tell your veterinarian if you are giving your dog any other medicines you think your dog may be taking, including any medicines you are getting for people. Your veterinarian will check that all of your dog's medicines can be given together without any problems.

What do I do if my dog eats more than the prescribed amount of Carpaquin Caplets? Contact your veterinarian immediately if your dog eats more than the prescribed amount of Carpaquin Caplets.

What else should I know about Carpaquin Caplets? This product sheet provides a summary and does not take the place of instructions from your veterinarian. Talk to your veterinarian if you do not understand any information or if you want to know more about Carpaquin Caplets.

Tell your veterinarian about:

• The risks and benefits of using Carpaquin Caplets.
• How often your dog may need to be examined by your veterinarian.
• If your dog has had an allergy or adverse reaction to Carpaquin Caplets.

Tell your veterinarian if your dog has ever had the following medical problems or conditions:

- Decrease or increase in appetite
- Vomiting
- Change in bowel movements (such as diarrhea, or black, tarry or bloody stools)
- Change in behavior (such as decreased or increased activity level, incoordination, seizure, or aggression)
- Yellowing of gums, skin, or whites of the eyes (jaundice)
